OpenShift Container Platform 4 for Operations

1. Introduction

    a. About OpenShift Kubernetes Engine
    b. Legal notice

2. Release Notes

    a. OpenShift Container Platform 4.6 release notes
    b. OpenShift Container Platform Versioning Policy

3. Architecture

    a. OpenShift Container Platform architecture
    b. Installation and update
    c. The OpenShift Container Platform control plane
    d. Understanding OpenShift Container Platform development
    e. Red Hat Enterprise Linux CoreOS (RHCOS)

4. Installing

    a. Installing on AWS
        i. Configuring an AWS account
        ii. Manually creating IAM for AWS
        iii. Installing a cluster quickly on AWS
        iv. Installing a cluster on AWS with customizations
        v. Installing a cluster on AWS with network customizations
        vi. Installing a cluster on AWS into an existing VPC
        vii. Installing a private cluster on AWS
        viii. Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates
        ix. Uninstalling a cluster on AWS

    b. Installation methods for different platforms
    c. Customizing nodes
    d. Validating an installation
    e. Troubleshooting installation issues

5. Updating clusters

    a. Updating a cluster between minor versions
    b. Updating a cluster within a minor version from the web console
    c. Updating a cluster within a minor version by using the CLI

6. Post-installation configuration

   a. Post-installation machine configuration tasks
      i. Understanding the Machine Config Operator
      ii. Using MachineConfig objects to configure nodes
      iii. Configuring MCO-related custom resources

   b. Post-installation cluster tasks
      i. Adjust worker nodes
      ii. Creating infrastructure machine sets
      iii. Moving resources to infrastructure machine sets
      iv. Creating an infrastructure node
      v. Creating infrastructure machines
      vi. About the cluster autoscaler
      vii. About the machine autoscaler
      viii. Recommended etcd practices
      ix. Pod disruption budgets

   c. Post-installation node tasks
      i. Deploying machine health checks
      ii. Recommended node host practices
      iii. Huge pages
      iv. Taints and tolerations
      v. Resource requests and overcommitment
      vi. Cluster-level overcommit
      vii. Node-level overcommit
      viii. Project-level limits
      ix. Freeing node resources using garbage collection
      x. Configuring the maximum number of pods per node

   d. Post-installation network configuration
      i. Configuring network policy with OpenShift SDN
      ii. Setting DNS to private
      iii. Enabling the cluster-wide proxy
      iv. Cluster Network Operator configuration
      v. Configuring ingress cluster traffic
      vi. Red Hat OpenShift Service Mesh supported configurations
      vii. Optimizing routing

   e. Post-installation storage configuration
      i. Dynamic provisioning
      ii. Defining a storage class
      iii. Changing the default storage class
      iv. Optimizing storage
      v. Available persistent storage options
      vi. Recommended configurable storage technology

     f.   Preparing for users
  - i.   Understanding identity provider configuration
  - ii.   Using RBAC to define and apply permissions
  - iii.   The kubeadmin user
  - iv.   Installing Operators from OperatorHub

     g.   Configuring alert notifications
  - i.   Sending notifications to external systems

7. Support

    a.   Getting support
    b.   Gathering data about your cluster
    c.   Summarizing cluster specifications
    d.   Troubleshooting
  - i.   Troubleshooting installations
  - ii.   Verifying node health
  - iii.   Troubleshooting CRI-O container runtime issues
  - iv.   Troubleshooting Operator issues
  - v.   Investigating pod issues
  - vi.   Troubleshooting storage issues
  - vii.   Investigating monitoring issues
  - viii.   Diagnosing OpenShift CLI (oc) issues

8. Web console

    a.   Accessing the web console
    b.   Using the OpenShift Container Platform dashboard to get cluster information
    c.   Configuring the web console in OpenShift Container Platform
    d.   Customizing the web console in OpenShift Container Platform
    e.   About the web terminal in the web console
    f.   Disabling the web console in OpenShift Container Platform

9. Security

    a.   Container security
  - i.   Understanding container security
  - ii.   Understanding host and VM security
  - iii.   Hardening RHCOS
  - iv.   Securing the container platform
  - v.   Securing networks
  - vi.   Securing attached storage
  - vii.   Monitoring cluster events and logs

    b. Configuring certificates
- i. Replacing the default ingress certificate
- ii. Adding API server certificates

    c. Certificate types and descriptions
- i. User-provided certificates for the API server
- ii. Proxy certificates
- iii. Service CA certificates
- iv. Node certificates
- v. Bootstrap certificates
- vi. etcd certificates
- vii. OLM certificates
- viii. User-provided certificates for default ingress
- ix. Ingress certificates
- x. Monitoring and cluster logging Operator component certificates
- xi. Control plane certificates

    d. Viewing audit logs
    b. Configuring the audit log policy
    c. Encrypting etcd data

10. Authentication and authorization

    a. Understanding authentication
    b. Configuring the internal OAuth server
    c. Understanding identity provider configuration
    d. Configuring identity providers
- i. Configuring an HTPasswd identity provider
- ii. Configuring a GitHub or GitHub Enterprise identity provider
    e. Using RBAC to define and apply permissions
    f. Removing the kubeadmin user
    g. Understanding and creating service accounts
    h. Using service accounts in applications
    i. Managing security context constraints
    j. Creating and using config maps

11. Networking

    a. Accessing hosts
    b. Cluster Network Operator in OpenShift Container Platform
    c. DNS Operator in OpenShift Container Platform
    d. Ingress Operator in OpenShift Container Platform
    e. Configuring the node port service range
    f. Network policy

12. Storage

    a.   Understanding ephemeral storage
    b.   Understanding persistent storage
    c.   Configuring persistent storage
        i.   Persistent storage using AWS Elastic File System
        ii.   Persistent storage using AWS Elastic Block Store
        iii.   Persistent storage using hostPath
        iv.   Persistent storage using local volumes
        v.   Persistent storage using NFS
    d.   Expanding persistent volumes
    e.   Dynamic provisioning

13. Operators

    a.   Understanding Operators
        i.   What are Operators?
        ii.   Operator Framework glossary of common terms
        iii.   Operator Framework packaging formats
        iv.   Operator Lifecycle Manager
            1.   Operator Lifecycle Manager concepts
            2.   Operator Lifecycle Manager architecture
            3.   Operator Lifecycle Manager workflow
            4.   Operator Lifecycle Manager dependency resolution
            5.   Operator groups
            6.   Operator Lifecycle Manager metrics
        v.   Understanding OperatorHub
        vi.   Extending the Kubernetes API with custom resource definitions
        vii.   Managing resources from custom resource definitions

    b.   User tasks
        i.   Creating applications from installed Operators
        ii.   Installing Operators in your namespace

    c.   Administrator tasks
        i.   Adding Operators to a cluster
        ii.   Upgrading installed Operators
        iii.   Deleting Operators from a cluster
        iv.   Viewing Operator status
        v.   Allowing non-cluster administrators to install Operators
        vi.   Managing custom catalogs

    d.   Red Hat Operators

14. Applications

    a. Quotas
        i. Resource quotas per project
        ii. Resource quotas across multiple projects

    b. Pruning objects to reclaim resources

15. Machine management

    a. Creating a machine set in AWS
    b. Manually scaling a machine set
    c. Modifying a machine set
    d. Deleting a machine
    e. Applying autoscaling to an OpenShift Container Platform cluster
    f. Creating infrastructure machine sets
    g. Deploying machine health checks

16. Working with nodes

    a. Viewing and listing the nodes in your OpenShift Container Platform cluster
    b. Working with nodes
    c. Managing nodes
    d. Managing the maximum number of pods per node
    e. Using the Node Tuning Operator
    f. Understanding node rebooting
    g. Freeing node resources using garbage collection
    h. Allocating resources for nodes in an OpenShift Container Platform cluster
    i. Machine Config Daemon metrics

17. Working with clusters

    a. Viewing system event information in an OpenShift Container Platform cluster
    b. Estimating the number of pods your OpenShift Container Platform nodes can hold
    c. Restrict resource consumption with limit ranges
    d. Configuring cluster memory to meet container memory and risk requirements
    e. Configuring your cluster to place pods on overcommitted nodes

18. Logging

     a. Understanding cluster logging
     b. Installing cluster logging
     c. Configuring your cluster logging deployment
     d. Viewing cluster logs
     e. Viewing cluster logs by using Kibana
     f. Forwarding logs to third party systems
     g. Collecting and storing Kubernetes events
     h. Updating cluster logging
     i. Viewing cluster dashboards
     j. Troubleshooting cluster logging
     k. Uninstalling Cluster Logging
     l. Exported fields

19. Monitoring

     a. Understanding the monitoring stack
     b. Configuring the monitoring stack
     c. Enabling monitoring for user-defined projects
     d. Managing metrics
     e. Managing alerts
     f. Reviewing monitoring dashboards
     g. Accessing third-party UIs
     h. Exposing custom application metrics for autoscaling
     i. Troubleshooting monitoring issues

20. Metering

     a. About Metering
     b. Installing metering
     c. Upgrading metering
     d. Configuring metering
     e. Reports
     f. Using Metering
     g. Examples of using metering
     h. Troubleshooting and debugging metering
     i. Uninstalling metering

21. Scalability and performance

   a. Recommended practices for installing large clusters
   b. Recommended host practices
   c. Recommended cluster scaling practices
   d. Using the Node Tuning Operator
   e. Using CPU Manager
   f. Using Topology Manager
   g. Scaling the Cluster Monitoring Operator
   h. Planning your environment according to object maximums
   i. Optimizing storage
   j. Optimizing routing
   k. Optimizing networking
   l. What huge pages do and how they are consumed by applications
   m. Performance Addon Operator for low latency nodes

22. Backup and restore

   a. Backing up etcd
   b. Replacing an unhealthy etcd member
   c. Shutting down the cluster gracefully
   d. Restarting the cluster gracefully
   e. Disaster recovery

23. CLI tools

   a. Getting started with the CLI
   b. Configuring the CLI
   c. Extending the CLI with plug-ins
   d. Developer CLI commands
   e. Administrator CLI commands
   f. Usage of oc and kubectl commands

24. Service Mesh

   a. Service Mesh Release Notes
   b. Understanding Red Hat OpenShift Service Mesh
   c. Service Mesh and Istio differences
   d. Preparing to install Red Hat OpenShift Service Mesh
   e. Installing Red Hat OpenShift Service Mesh
   f. Configuring the Red Hat OpenShift Service Mesh installation
   g. Deploying applications on Red Hat OpenShift Service Mesh
   h. Data visualization and observability
   i. Customizing security in a Service Mesh
   j. Traffic management
   k. Custom resources
   l. Removing Red Hat OpenShift Service Mesh

25. Jaeger

   a. Jaeger Release Notes
   b. Jaeger architecture
   c. Installing Jaeger
   d. Configuring and Deploying Jaeger
   e. Upgrading Jaeger
   f. Removing Jaeger

26. API reference
